

A Controlled Test of Traceable Citation Evidence

Paper T-Rail QA Fixture Team | Synthetic manuscript for local validation

TEST DOCUMENT - The scenarios below are synthetic. Use this Source Document only in a local/test environment. Footer text is the visible QA oracle, not manuscript content.

ABSTRACT

This synthetic manuscript exercises citation parsing, claim boundaries, reference matching, and source-span tracing. It includes one exact match for the repository's recorded local scholarly-work fixture, one deliberately unmatched journal reference, and one website reference.

1. INTRODUCTION

SCENARIO C-01 | SIMPLE CITED PROPOSITION

Conservative reference resolution prevents ambiguous bibliography entries from being assigned an unsupported paper identity [1].

The final Evidence Coverage Report is a triage aid, not a truth certificate. This sentence is intentionally uncited and should not create a claim verification.

CLAIM EXPECTATION

C-01: one Atomic Claim; R1 matches the checked-in DOI/full-text fixture. Final semantic status depends on provider selection; this PDF is not model-accuracy evidence.

2. Claim Boundaries and Qualifiers

2.1 SHARED POPULATION QUALIFIER

SCENARIO C-02 | COORDINATED PREDICATES

Among older adults, treatment reduced pain and improved mobility [1, 2].

2.2 AMBIGUOUS NEGATION

SCENARIO C-03 | DO NOT GUESS NEGATION SCOPE

Treatment did not improve symptoms and reduce dropout [1].

2.3 AMBIGUOUS TRAILING QUALIFIER

SCENARIO C-04 | PRESERVE UNCERTAIN QUALIFIER SCOPE

Treatment reduced pain in older adults and improved mobility [1].

The examples are fixtures for claim-shape behavior; they are not empirical findings about the cited paper.

CLAIM EXPECTATION

C-02: two claims with the shared qualifier and both targets; C-03/C-04: one conservative claim each, with negation and scope preserved.

3. Citation Contexts and Source Spans

3.1 MULTIPLE MARKERS IN ONE CONTEXT

SCENARIO C-05 | TWO MARKERS, ONE CONTEXT

Prior work supports this method [1] and reports similar outcomes [2].

3.2 CITATION-BEARING CLAUSES

SCENARIO C-06 | SEPARATE CLAUSES

The treatment improved symptoms [1]; however, controls found no effect [2].

3.3 UNCERTAIN BOUNDARY AND DUPLICATE WORDING

SCENARIO C-07 | SENTENCE FALLBACK

Prior work supports the method [1], which remains under discussion [2].

SCENARIO C-08 | SAME WORDING, DIFFERENT LOCATIONS

The intervention improved mobility [1].

The intervention improved mobility [1].

3.4 UNCITED AND AUTHOR-DATE EXAMPLES

SCENARIO C-09 | NO CITATION

A proposition without a citation appears here and should not be verified.

SCENARIO C-10 | AUTHOR-DATE MARKER

The study describes a conservative reference-resolution method (Example & Researcher, 2024).

CLAIM EXPECTATION

C-05 shared targets; C-06 separate clauses; C-07 fallback; C-08 distinct spans; C-09 uncited; C-10 author-date if parsed, R1 exact DOI -> RESOLVED; R2 unmatched -> UNRESOLVED; inspect R3 type before unsupported outcome.
